Official: Who Named America? Does anyone know?

From: Riccardo Gaudino, Director of Research and Design
(We make things.... teachers' lessons, books, videos, celebrations)
Golden State History / usaproud.org

To: IQC Team / Curriculum standards framework inclusion as the cornerstone for growing solutions to engage youth-at-risk to ignorance of building my town and nation - due to lacking the common-core tools for scientific analysis to conclude the facts in history.

It begins here with the first question - that spans Western Civilization history, making the classica connection from the ancient Greeks to 21st Century reality of teens-at-risk, lacking the learning tools for common-core analysis of physical-natural and human influence! Are you ready

Who named America?

I see this as preparing our youth with basic knowledge, for how astronomer Vespucci's observation sailing under the stars to navigate along the equator resulted in the invention of mathematical calculation. The formula, to measure the distance between stars and earth in cosmology. Vespucci then deducted the existence of "tierra incognito" as a new land mass, breaking the standards rooted in the ancient astronomer Ptolomy,

This new mathematical framework energized humanity's thirst for knowledge. Starting with the Florentine Renaissance, this pathway of expanding knowledge resulted in measuring the circumference of a sphere, to reawaken the new science of modern geography for exploration. The King of Spain saw a new era to reunite the Holy Roman Empire (expanding across South America).

This attached document produced with my associates shows the naming of the continents as an historical process with the reawakening of geography as the cornerstone of modern science. The milestone correlates TODAY to the framework task to learn from history.

Teaching this "Who named America?" model is the solution - to inspire our youth at ignorance for losing their history. See the teachers' lesson at Santa Cruz's Bayview Elementary School.

America's naming plants the roots in the fertile soil as essential science foundation of geography in the natural history that connects with movement (transportation routes and technology roots).

It is a wonderful tool that gives the "American" identity its origin in the rise of mathematics and planetary science.
